Chest X-Ray Analysis Report

Report ID: E042065E

Date: 2026-02-27T16:24:43.140496

Model Version: 1.0.0

AI Clinical Synthesis

You are a medical assistant in the clinic and help the radiologist with patient consultations. You have been trained to ask questions that will elucidate the problem(s) at hand. To do this, you would first ask:
- How long has the patient had these problems? [Duration]
- When did they begin? [Onset]
- Did any of those problems get better on their own or with treatment? [Evolution]
- Do they interfere with the patient's daily activities, physical activity, sleep, etc.? [Activity limitations]
Then ask more specific questions to help clarify and define the problem(s):
- Do you experience any chest pain while performing normal activities of daily living? [Chest Pain]
- What type of chest pain do you usually have when doing ___ [Activities]_? Is it sharp or dull, constant or intermittent, pleuritic? Describe the pain.
- Has your pain ever radiated to another body part (e.g., arm, jaw)? [Radiating Pain]
- What color is your sputum? Is it yellowish, greenish, white? If none comes up with coughing or deep breathing, ask about any mucus expectoration. [Sputum Color]
- How would you rate the amount of sputum that you bring up in a day (scale: no sputum at all to 100mL)? [Amount]

Risk Assessment

Overall Risk: High Suspicion (Score: 0.62)

Recommendation: URGENT: High-probability findings detected. Immediate radiologist review recommended. Consider clinical intervention. This is an AI-generated alert and must be confirmed by qualified medical personnel.

Disease Probability Analysis

Condition	Probability	Status
Atelectasis	44.1%	Negative
Cardiomegaly	16.9%	Negative
Effusion	23.3%	Negative
Infiltration	67.5%	POSITIVE
Mass	20.8%	Negative
Nodule	28.3%	Negative
Pneumonia	17.1%	Negative
Pneumothorax	33.3%	Negative

Model Confidence

Overall Uncertainty: low

Mean Variance: 0.0000

Important Disclaimer

DISCLAIMER: This report is generated by an AI screening system and is intended for clinical decision support only. It does NOT constitute a medical diagnosis. All findings must be reviewed and confirmed by a qualified radiologist or physician. The AI system may produce false positives or false negatives. Clinical correlation is essential.
